EPISODE 14

Enabling data mesh with Dremio Arctic and Data as Code

Agenda

- Level Set: What is a data mesh?
- What you need from your data platform to enable a data mesh architecture
- Dremio Arctic and data as code
- Advantages of data as code for data mesh architectures

What is a Data Mesh?

A data mesh is a modern approach to data management that emphasizes distributed ownership and governance of data within domains, who then build, manage, and share data products across the organization.

Why All the Hype?

Distributed data probably isn't going anywhere

Tension between IT and Line of Business

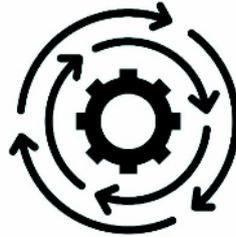

A Sociotechnical Approach to Data Management

People

Organize people
around data

Processes

Decentralized data
management, build data
products, enable self-service

Technology

Unified Access
Layer

Pros and Cons of a Data Mesh

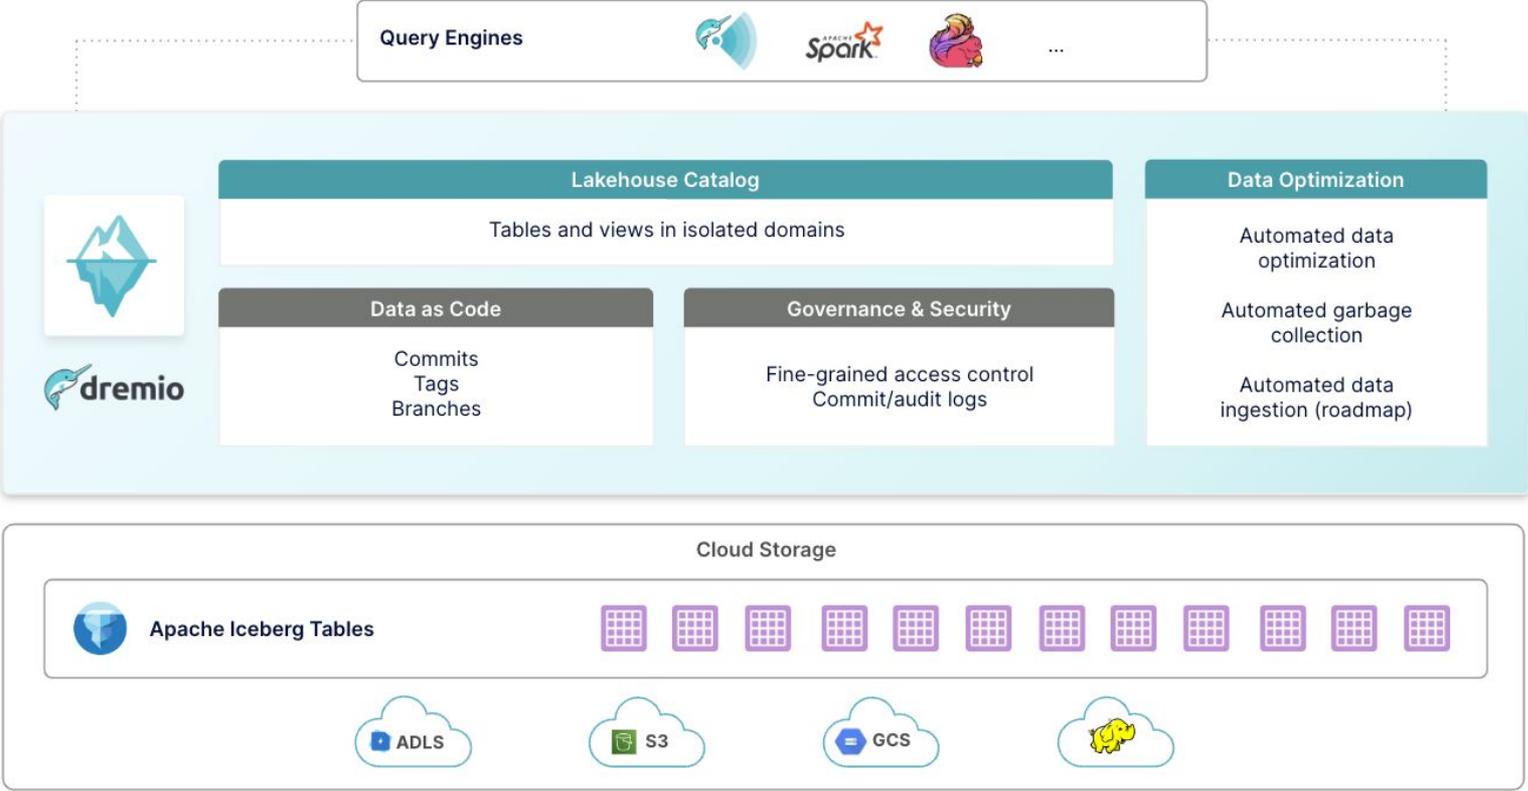

- ✓ Domain owners know and understand their data better than anyone
- ✓ Data mesh can be more cost efficient
- ✓ It may be the only realistic way to unify data sources

- ✗ Security and governance can be more challenging
- ✗ Data talent is getting harder to find
- ✗ Self-service access to a unified and consistent view of data can be hard

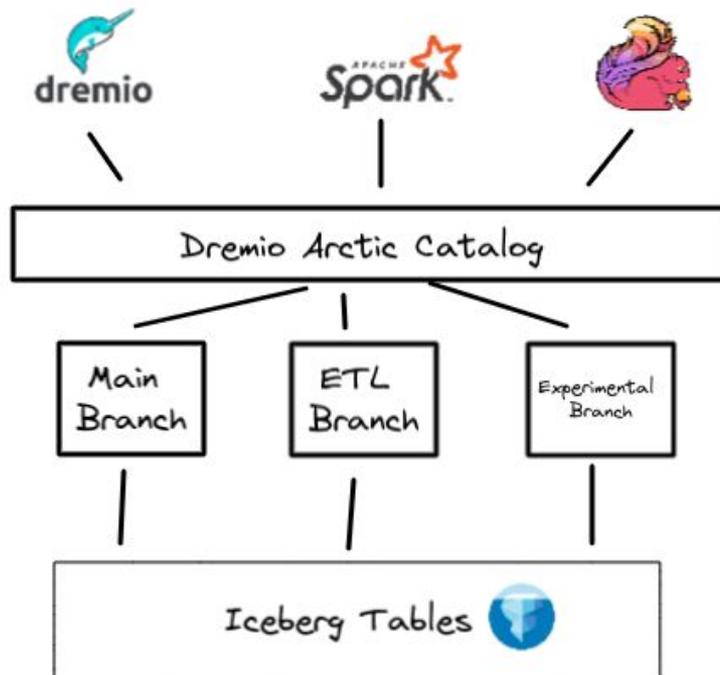

Dremio Arctic and Data as Code

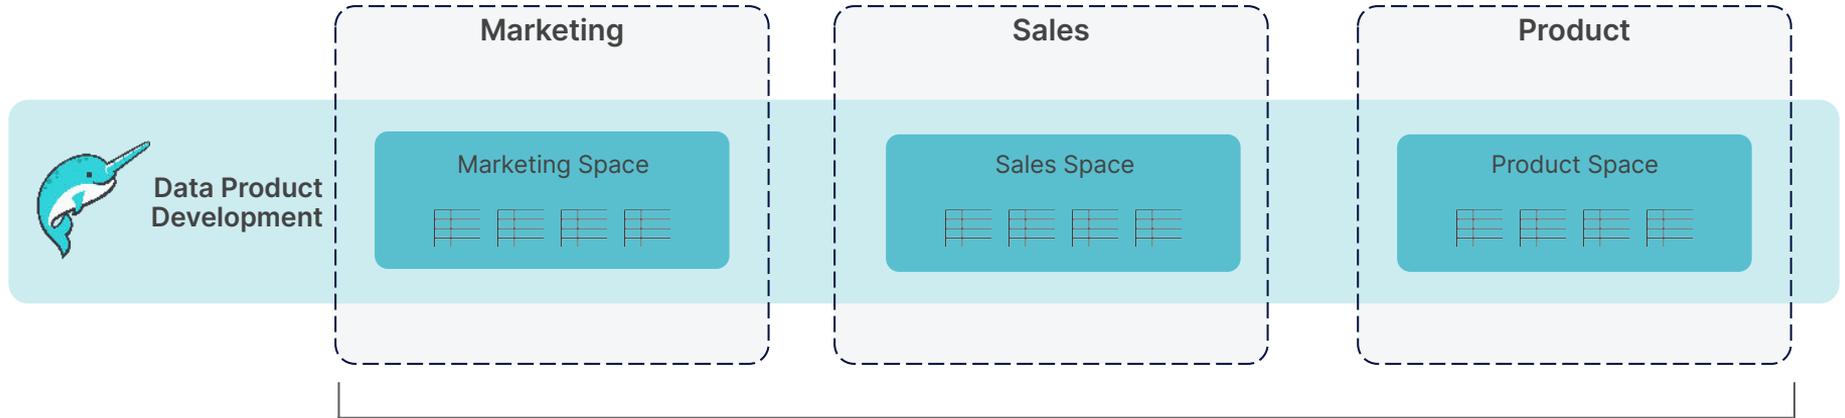

Dremio Arctic is a Data Lakehouse Management Service

Data as Code within Dremio Arctic: A Quick Refresher on Branches, Tags, and Commits

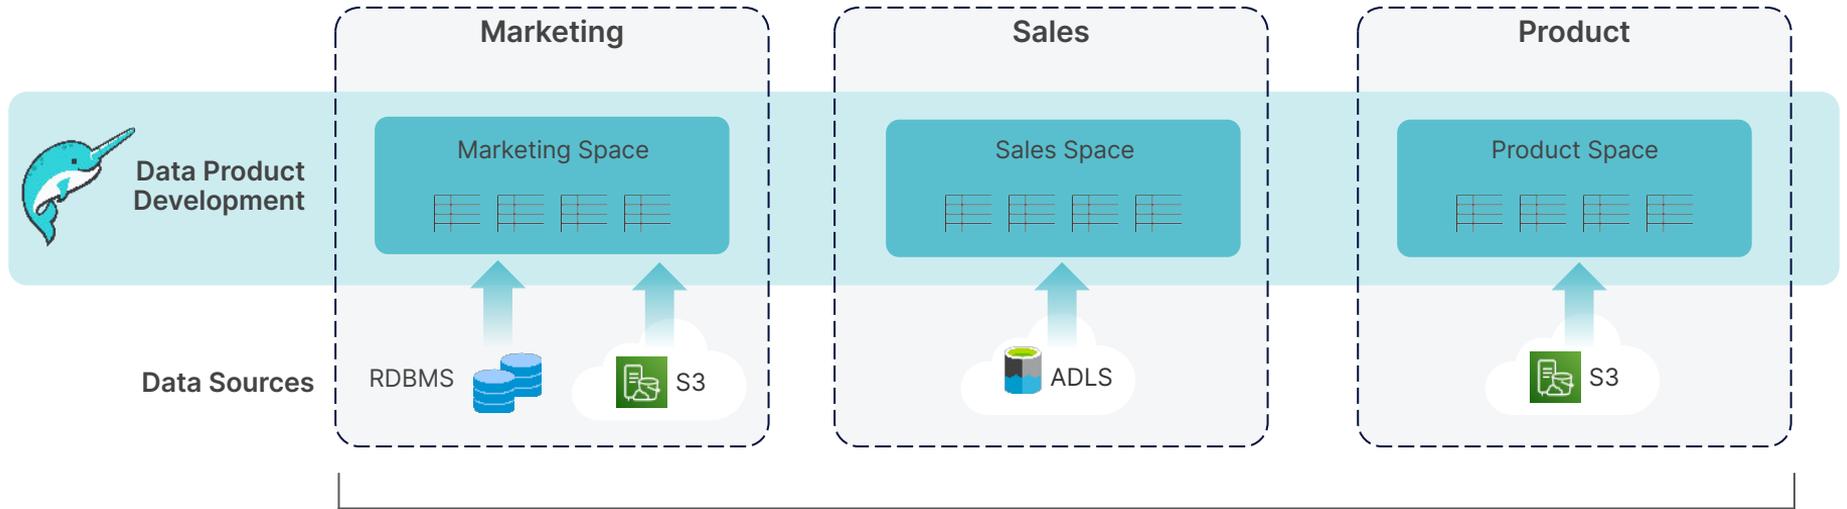

Create the Foundation for a Domain-Oriented Architecture

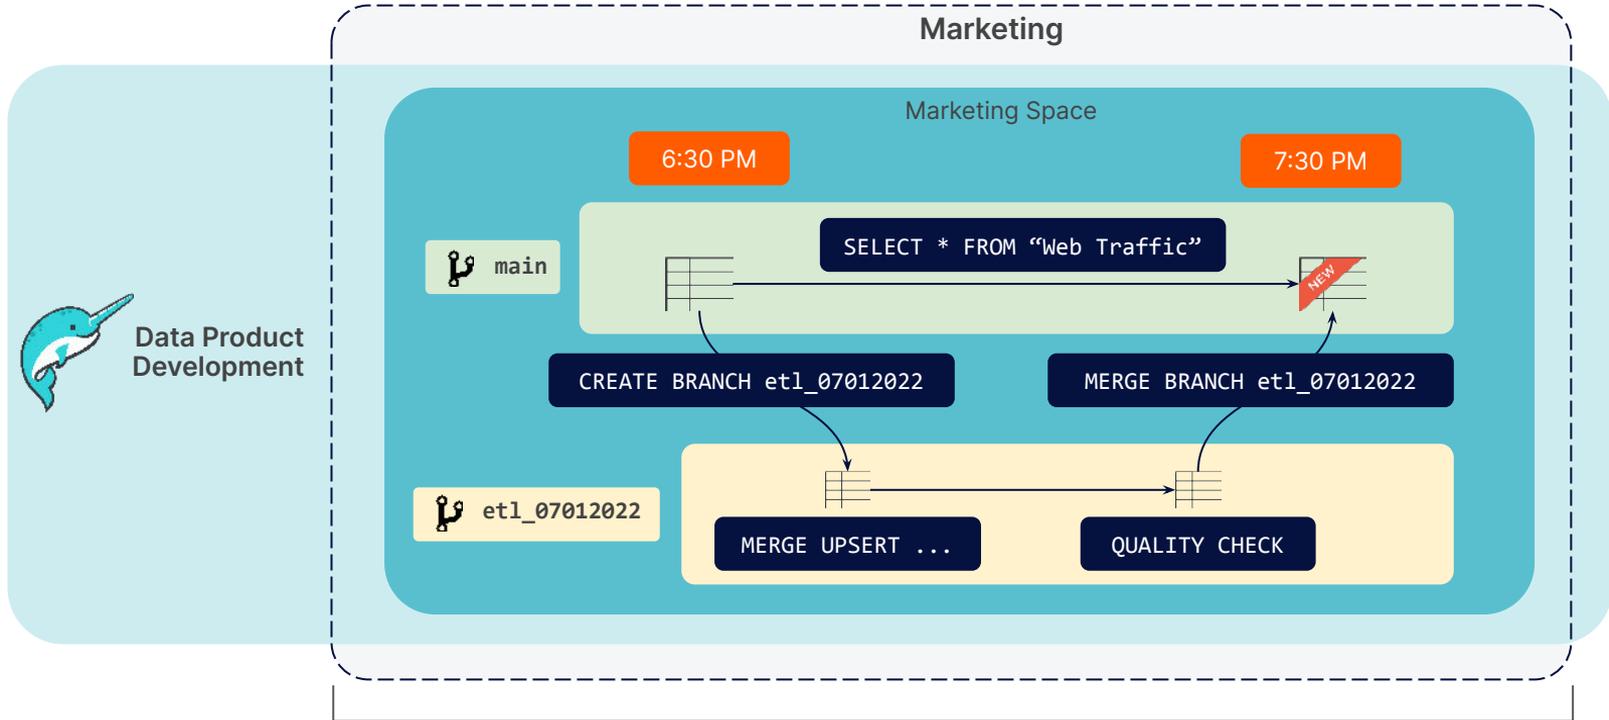

- Isolated environments for domains
- Leverage common auth and ACLs

Develop and Manage Data Products

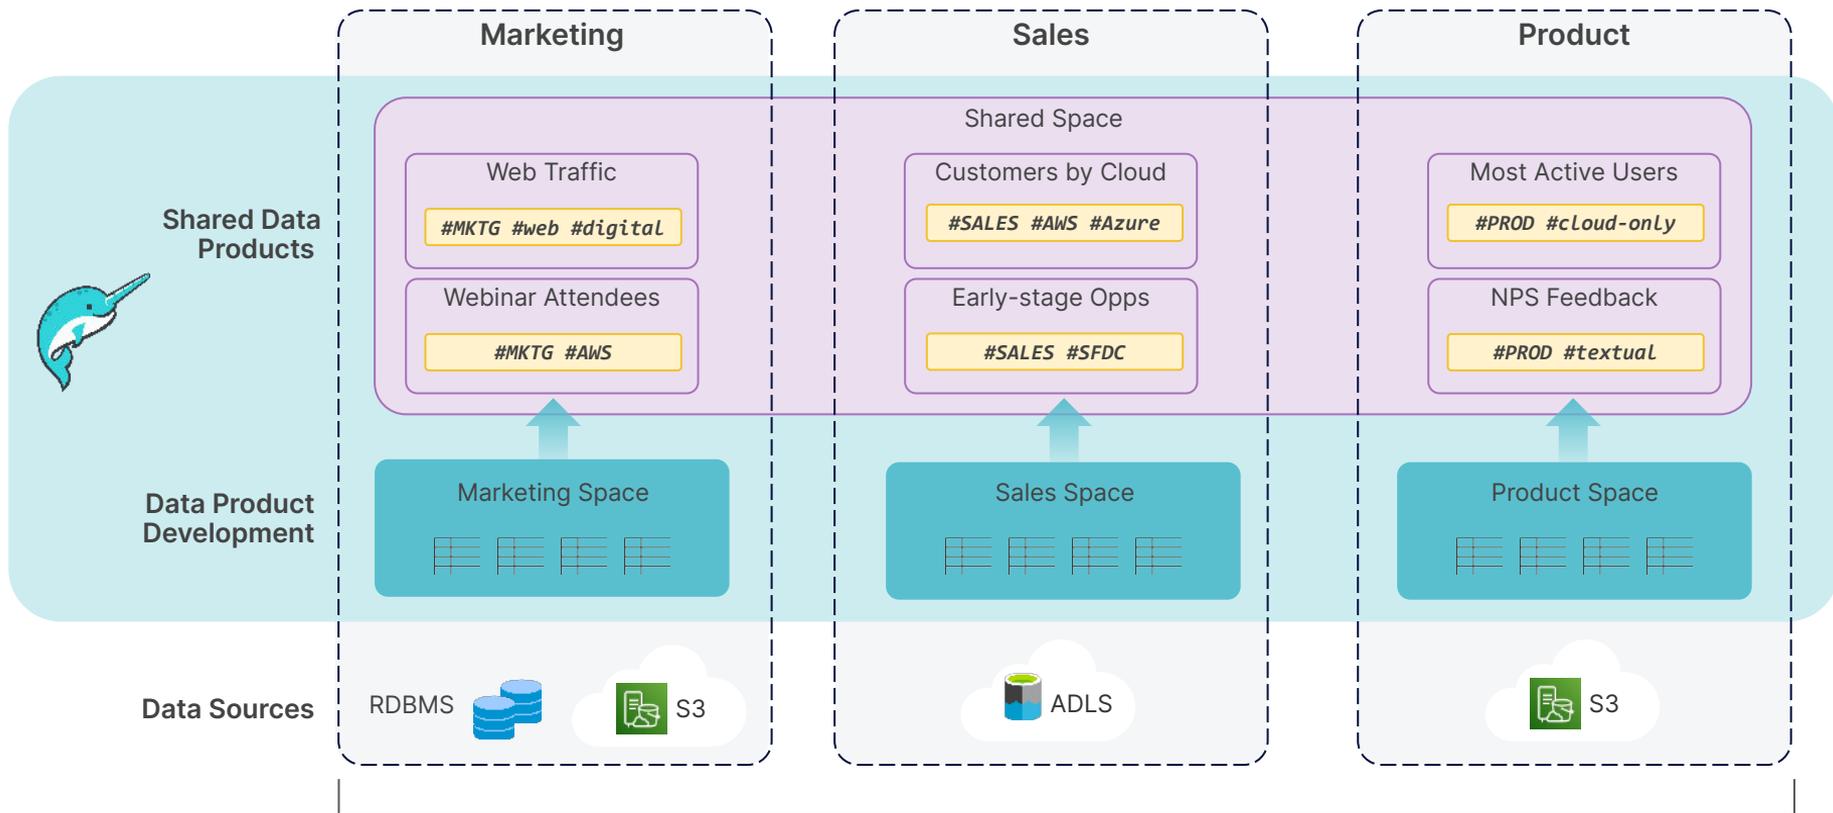

- Use data from any source to build data products
- Safely experiment and create data products without creating physical copies of data

Manage Data Products Like Code

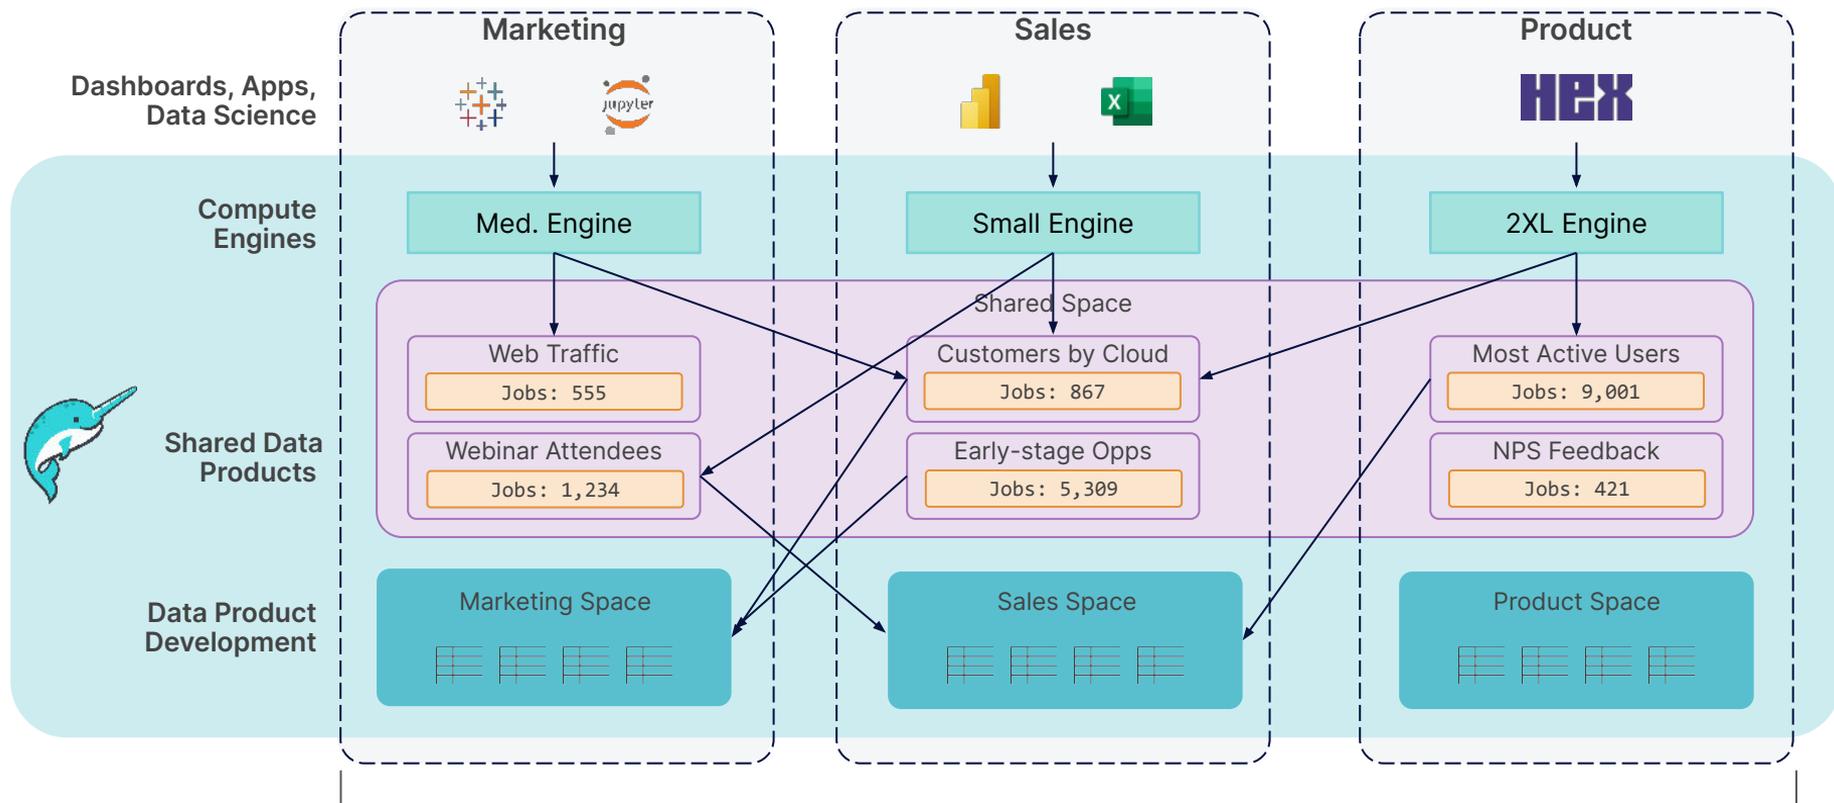

- Data engineers can use git-like branching to transform data across tables and schemas in isolation without impacting production workloads, and merge data changes once they're tested and ready
- Data consumers can only query the main branch, and can immediately access updated versions of datasets as they're pushed to the main branch

Share Data Products Seamlessly

- Add context and tags to data products for others to leverage, and publish data to a shared public space when ready

Consume Data Products Easily

- Use your favorite tools to analyze any data available to you, using live queries — no need for data extracts/imports
- Combining other domains' publicly-shared data with your own data products
- Create physically isolated, right-sized, autoscaling compute engines so domains can work without bottlenecks

Advantages of Data as Code for Data Mesh Architectures

Collaboration

Easily identify milestones in the lifecycle of a data product.
Work on data products simultaneously without impacting each other.

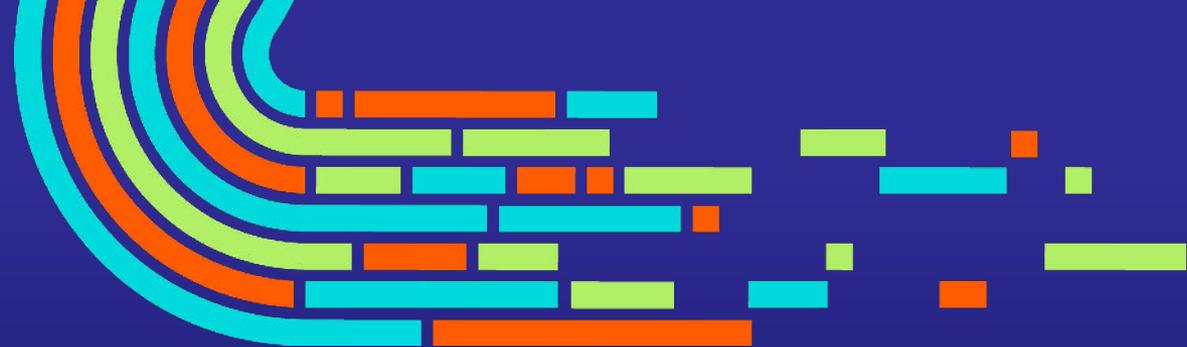

Consistency

Deliver an accurate and consistent view of the data within your production branch across data consumers.

Quality Assurance

Ensure high quality data products by making changes in isolation and testing them before making a commit.
